a
PRISMA-style search, screening and reproducibility attrition
Merged database records identified n = 5127
Duplicates removed n = 1133
Unique records after PMID deduplication n = 3994
A/B title-level triage queue n = 1234
Title-level excluded/deferred n = 2760 C1/D0/E0 classes
B-borderline retained n = 498 not primary target queue
A-priority abstracts triaged n = 736
P0/P1 full-text target queue n = 460
P2/P3 deferred or boundary n = 276
Full-text LUAD articles audited n = 178
Full-text assessed but excluded before audit n = 282
Formula-reproducible signatures n = 57
Excluded from formula-level analyses n = 121 insufficient reporting or non-computable formula
Manuscript-triage signatures n = 27
Not advanced beyond all-57 landscape n = 30 gene coverage, overlap, endpoint or weak evidence
Triage signatures not primary n = 17 secondary or continuous-only role
Primary candidates n = 10
Strict reported-cutoff primary candidate n = 1 A131
Search records were recovered from merged multi-database PubMed-format exports; per-database raw counts were not separately retained.
